Length measurement conversion worksheets

Go to the main contentOne of the strong trends that came out of New York Fashion Week was full skirts and dresses in a new length - mid-calf. Think of 1950s poodle skirts without a poodle. I know now to say never, but besides a tall thin girl, who can wear this? I know I can't. Thoughts? February 14, 2008 2008 Getty ImagesA of the strong trends that came out of New York Fashion Week was full skirts and dresses in a new length - mid-calf. Think of 1950s poodle skirts without a poodle. I know now to say never, but besides a tall thin girl, who can wear this? I know I can't. Thoughts? A weekly guide to everything you need to add to cart, but not yet. Wood can be measured in a number of ways, meaning that foresters, woodholders, and wood owners may find themselves needed to convert some of these measurements. To understand these conversions, you first need to know some of the common terminology: A standard cord is a four-foot by four foot by eight-foot pile of wood. A board foot is a wooden board that measures one-inch by 12-inch by one-inch. MBF means a thousand board feet. A log rule is a tabular system used to determine the net volumetric yield of a log. A cubic foot is equivalent to a 12-foot by 12-foot by 12-foot solid cube of wood. Here is a list of the types of conversions often made in the timber industry. When it comes to running these, online converters are useful. Poles at charging dock. Photo by Steve Nix, Licensed to About.com Estimated weight conversion for pine sawtimber's board measure to measure weight pine cord wood. kayakaya/Flickr image Estimated weight conversion for pine pulpwood from cord measure to weight measure Hardwood Cord Wood. Horia Varlan/Flickr image Estimated weight conversion for hardwood pulpwood from cord measure to weight measure White Oak Logs. DepDep/Flickr Image Estimated weight conversion for hardwood sawtimber of plate measure to measure lump charcoal weight. epSos.de/Flickr image Estimated weight conversion for charcoal from weight size to board size Estimated weight conversion from pine pulp wood to pine sawdust Estimated weight conversion from hardwood pulp to hardwood timber Cypress Log. Steve Nix Estimated wood volume conversion of thousand board feet to cubic foot measure Estimated volume conversions of board feet to cubic foot measure Estimated wood volume conversion of standard cords to cubic foot measure Estimated wood volume conversion of solid choir dents to cubic foot size Estimated wood volume conversion from cunit to cubic foot measure Estimated wood volume conversion of scribner log rule to Doyle log rule Estimated wood volume conversion of Doyle log rule to Scribner log rule Estimated wood volume conversion of International log rule to Scribner log rule Estimated wood volume conversion International log rule Doyle log rule Estimated wood volume conversion of Doyle log rule to Scribner log rule Estimated wood volume conversion of log rule to International log rule Estimated wood volume conversion of International log rule to Scribner log rule Estimated wood volume conversion International log rule Doyle log rule Estimated wood volume conversion from Doyle log rule to International log rule Estimated volume conversion for pine of board measure to cord measure Stacked Wood. Texas A&M Estimated volume conversion for hardwood from board size to cord measurement Estimated piece conversion for poles to board foot size Estimated piece conversion for railroad tires to board foot size Estimated piece conversion for handles to walkbars to measure Shutterstock As soon as your child enters first and second grade, you strengthen basic measurement skills with these free worksheets. She gets exercise measuring in centimeters, centimeters, feet, yards, cups, quarts, and pints. Christopher Kimmel/Moment/Getty Images Measuring a chainsaw beam length is a simple process that can be performed in minutes with just a tape measure. The chainsaw beam length identifies the size of the chainsaw cutting area. Find the point where the chain in the case cuts the cut part of the chainsaw, so you usually only measure to the point where the chain is present. Find the end of the barThe end of the bar is the farthest point of the bar from the enclosure. Measure between the housing and the bar tipAf away from finding the point where the chain enters the casing and the end of the bar, simply measure the distance between the two points with a tape measure. Data can be classified into one of the four measurement levels. These levels are nominal, ordinal, interval and ratio. Each of these measurement levels indicates a different function that reflects the data. Read the full description of these levels, then practice sorting through the following. You also look at a version with no answers, then come back here to check your work. Specify the level of measurement used in the given scenario: SOLUTION: This is the nominal measurement level. Eye color is not a number, so the lowest measurement level is used. SOLUTION: This is the ordinal level of measurement. The letter qualities can be ordered with A so high and F so low, but differences between these qualities are meaningless. An A and a B grade can be separated by a few or more points, and there's no way to tell if we just have a list of letter qualities. SOLUTION: This is the measurement level. The numbers have a range of 0% to 100% and it makes sense to say that one score is a multiple of another. SOLUTION: This is the interval level of the measurement. The temperatures can be ordered and we can look at differences in temperatures. However, a statement such as "A day of 10 degrees is half as hot as a day of 20 degrees" is not correct. So this is not at the ratio level. SOLUTION: This is also the interval level of the measurement, for the same reasons as the last problem. SOLUTION: Be careful! Even though this is a different situation with regard to as data, this is the level of measurement. The reason for this is that the Kelvin scale has an absolute zero point from which we can refer to all other temperatures. The zero for the Fahrenheit and Celsius scales is not the same, because we can have negative temperatures with these scales. SOLUTION: This is the ordinal level of measurement. The ranking is ordered from 1 to 50, but there is no way to compare the differences in rankings. Film #1 could beat #2 by just a little, or it could be vastly superior (in the critic's eye). There is no way to know rankings alone. SOLUTION: Prices can be compared at the measurement ratio level. SOLUTION: Although numbers are associated with this dataset, the numbers serve as alternative forms of names for the players and the data is at the nominal measurement level. Ordering the sweater numbers makes no sense, and there is no reason to do an arithmetic with these numbers. SOLUTION: This is the nominal level due to the fact that dog breeds are not numerical. SOLUTION: This is the measurement level. Zero pounds is the starting point for all weights and it makes sense to say "The 5-pound dog is a quarter of the weight of the 20-pound dog. The teacher of a class of third graders records the height of each student. The teacher of a class of third-graders records the eye color of each student. The teacher of a class of third graders registers the grade for math for each student. The teacher of a third grader's class records the percentage each student received correctly on the last science test. A meteorologist compiles a list of temperatures in degrees Celsius for the month MayA meteorologist compiles a list of temperatures in degrees Fahrenheit for the month MayA meteorologist compiles a list of temperatures in degrees Kelvin for the month MayA film critic lists the top 50 greatest movies of all time. An auto magazine lists the most expensive cars for 2012. The roster of a basketball team lists the jersey numbers for each of the players. A local animal shelter keeps track of the dog breeds that come in. A local animal shelter keeps track of the weights of the dogs that enter. Tammy Jones/Getty Images Students should be able to estimate and calculate conversions of different types, including units of measurement. These worksheets require conversion between feet and centimeters and centimeters to feet. Sample questions are: 88 in = 7 ft 4 in (ft)113 ft = 1,356 in (in)67 in = 5 ft 7 in (ft)139 ft = 1,668 in (in)88 ft = 1.17 6 in (in)115 in = 9 ft 7 in (ft)23 in = 1 ft 11 in (ft)82 ft = 984 in (in)30 in = 2 ft 6 in (ft)101 in = 8 ft 5 in (ft)112 ft = 1,344 in (in)45 ft = 540 in (in)64 ft = 768 in (in)25 ft = 300 in (in)12 ft = 1,536 in (in)16 in = 1 ft 4 in (ft)74 ft = 888 in (in)20 ft = 240 in (in)18 ft = 216 in (in) Print the PDF Converting and inches or feet using the requested unit. Answers are on the 2nd page of the PDF. Print the PDF convert from centimeters or feet using the requested unit. Answers are on the 2nd page of the PDF.
